UNIT-2

EFFECTIVE SPEAKING

Prepared By- Prof.N.K.Thakre
Department of Humanities & Mathematics
YCCE

CONTENTS

- 1- Importance of Medium of Speech
- 2.What is Phonetics?
- 3.What is Air stream Mechanism?
- 4. Types of Air Stream Mechanism

Importance of Medium of Speech

- The medium of speech is more important than the medium of writing because speech comes first in the history of any language community.
- Speech comes first in the history any individual. Speech is a medium of communication which is used more than the written medium.
- Language in written mode is just a representation of sounds used in spoken language.
- Written Language is only an attempt to represent , using marks on paper , the sounds used in spoken language

Linguistics & Phonetics

- **Linguistics**:- It is a systematic study of language .
- It involves and analyzing language form, language meaning and language in context.
- Linguistics traditionally analyses human language by observing an interplay between sound and meaning.
- **Phonetics** :- It is the branch of linguistics.
- it is the branch dealing with the medium of speech .
- It deals with the **production**, **transmission** and **reception of the sounds of human speech.**

Air stream Mechanism

- For production of speech sounds we need an air stream .
- Eg.- If you put the in front of your mouth while saying ‘ ah’, your palm will feel the warm air getting out of your mouth.
- The air that flows out of your mouth is modified into speech sounds by the action of certain organs of your body
- These organs referred to as **Organs of Speech**
- Thus ,an air stream is the basis of speech sounds
- An **Air Stream** can also be called a **moving current of air**.
- For the articulation of most **speech sounds** of most languages , **lung air is used.**
- The air that we breathe out is modified into speech sounds.

Types of Air Stream Mechanism

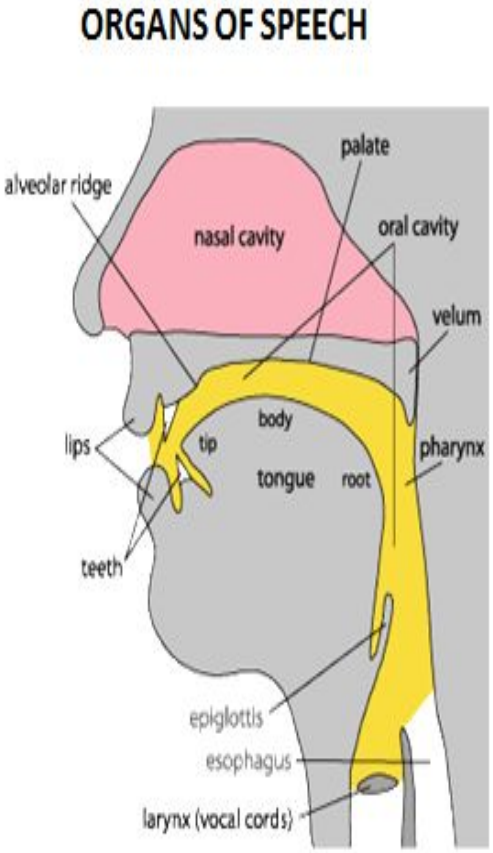

- There are **three main air –stream mechanisms**
- **i) <u>Pulmonic</u> air stream Mechanism**
- **ii) <u>Glottalic</u> Air Stream Mechanism**
- **iii) <u>Velaric</u> Air Stream Mechanism**

Pulmonic Air Stream Mechanism

- The **Pulmonic air stream mechanism** consist of the **lungs and the respiratory muscles.**
- The **walls of the lungs** work as the initiator.
- They are moved by the respiratory muscles so that air drawn into the lungs or pushed out of them.
- When the air-stream mechanisms is used to **push air out**, it is called as **egressive** and ,
- when it is used to **drew air in**, it is called **ingressive.**
- **Most speech sounds make use of a pulmonic egressive air stream mechanism**
- **All the sounds of English and most Indian languages(Sindhi is an exception) are produced with this air stream mechanism**
- **No languages use ingressive air stream mechanism , we use this air stream mechanism for yawning and snoring, but not for speaking**

Glottalic Air Stream Mechanism

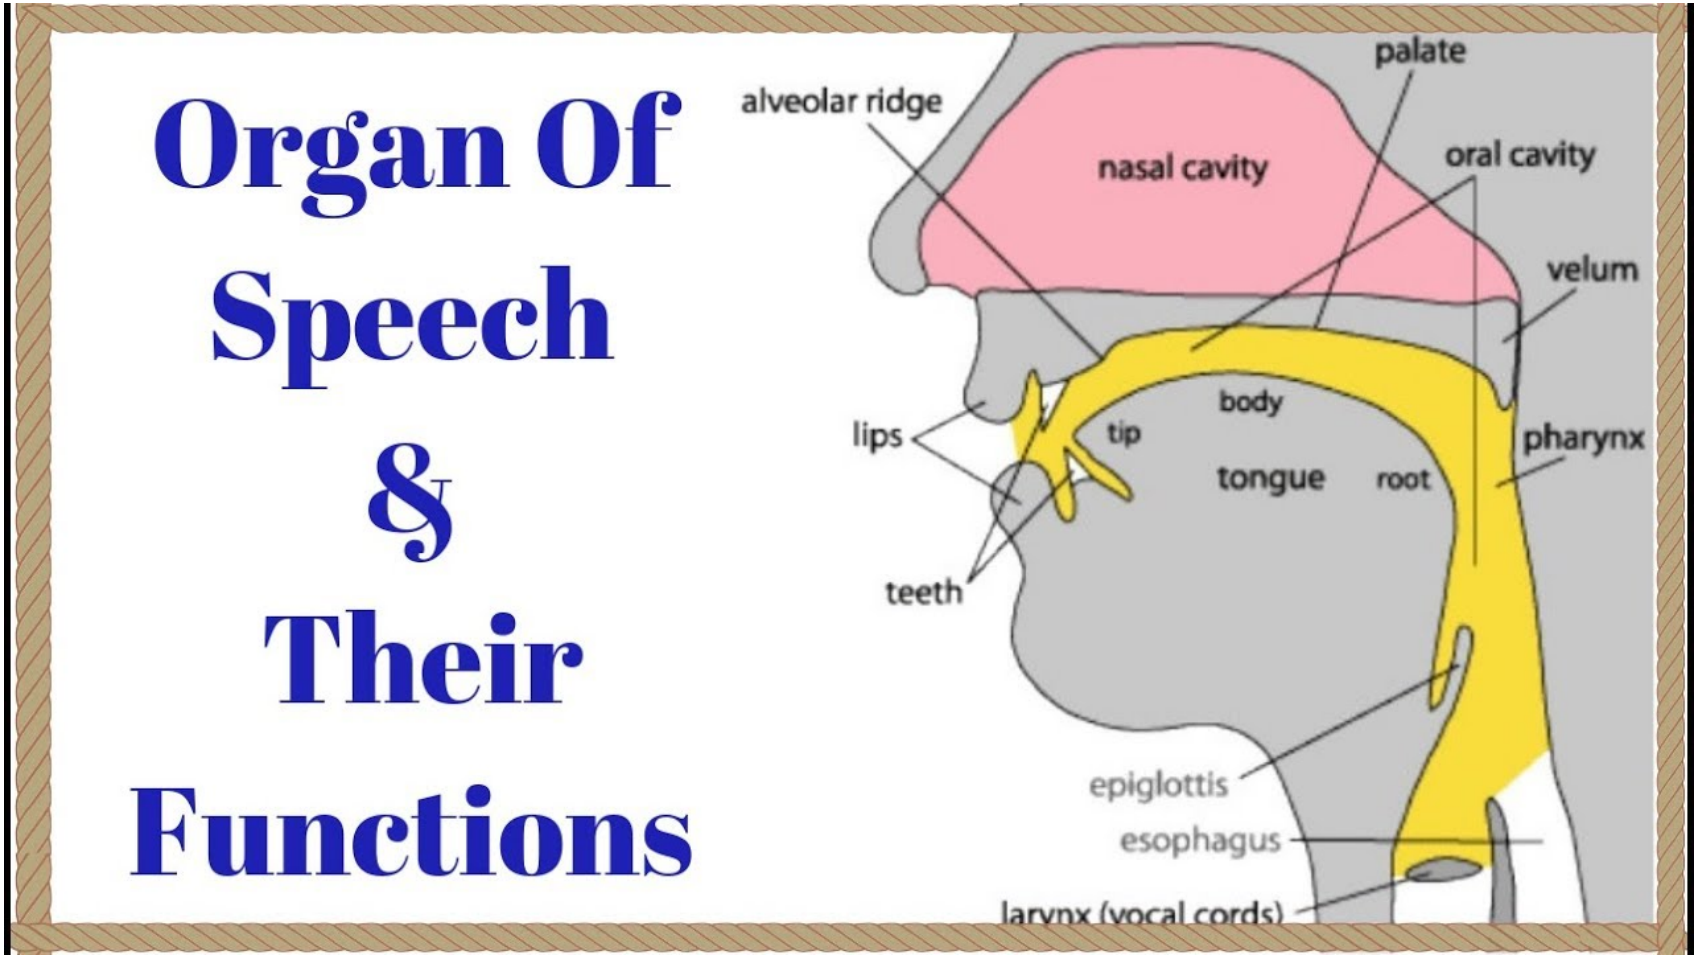

- The **closed Glottis** acts as the **initiator** for this and the air in the pharynx is used .
- For this reason some linguists refer to this air-stream mechanisms as **Pharyngeal.**
- Both **egressive** and **ingressive** glottalic air stream mechanism are used by some languages of the world for the articulator of speech sounds.
- Among Indian Languages, Sindhi has sounds that are articulated with a glottalic ingressive and air –stream mechanism.

Velaric Air Stream Mechanism

- In **Velaric air stream mechanism** the **back of the tongue** is the **initiato**r and the **air in the mouth is in motion** during this air stream mechanism.
- This is also therefore referred as **oral air stream mechanism**.
- Sounds with **velaric ingressive mechanism** exist in several African languages, sounds with veralic egressive air stream mechanism do not seem to exist in any language.

Organs of speech

QUESTIONS?

- Q1.Explain the different air-stream Mechanism?

  Q2. Draw a neat diagram of organs of speech with appropriate labeling.
